

Abstract

We are developing a web-based system to allow updating and subsetting of altimeter data. This is crucial to the expanded use and improvement of altimeter data. The service aspect is necessary for altimetry because the result of most interest (sea surface height anomaly, SSHA) is composed of several components which are updated individually and irregularly by specialized experts. This makes it difficult for projects to provide the most up-to-date products. Some components are the subject of ongoing research, so the ability for investigators to make products for comparison or sharing is important. The service will allow investigators/producers to get their component models or processing into widespread use much more quickly. For coastal altimetry, the ability to subset the data to the area of interest and insert specialized models or data processing results is crucial.

A key part of the Altimeter Service is having data producers provide updated or local models and data. In order for this to succeed, producers need to register their products with the Altimeter Service and agree to provide the product either on demand or in a way that can be integrated into the basic altimeter data record structure.

Objective

- Develop a web-based tool for subsetting and updating altimeter data
 - Altimeter data consist of several specialized “components” that are updated by different groups at irregular intervals.
 - Specialized data exist for localized areas.
- Work with providers to get tool access to data and models as they are updated.
 - Locate specialized models for coastal areas.

- Atmospheric – range, inverse barometer

Altimeter Sea Surface Height Measurement Components for Updating:

- Orbit
- Tides
- Radiometer
- Geoid
- Range processing, corrections

This service will be permanently installed at PO.DAAC in 2010.

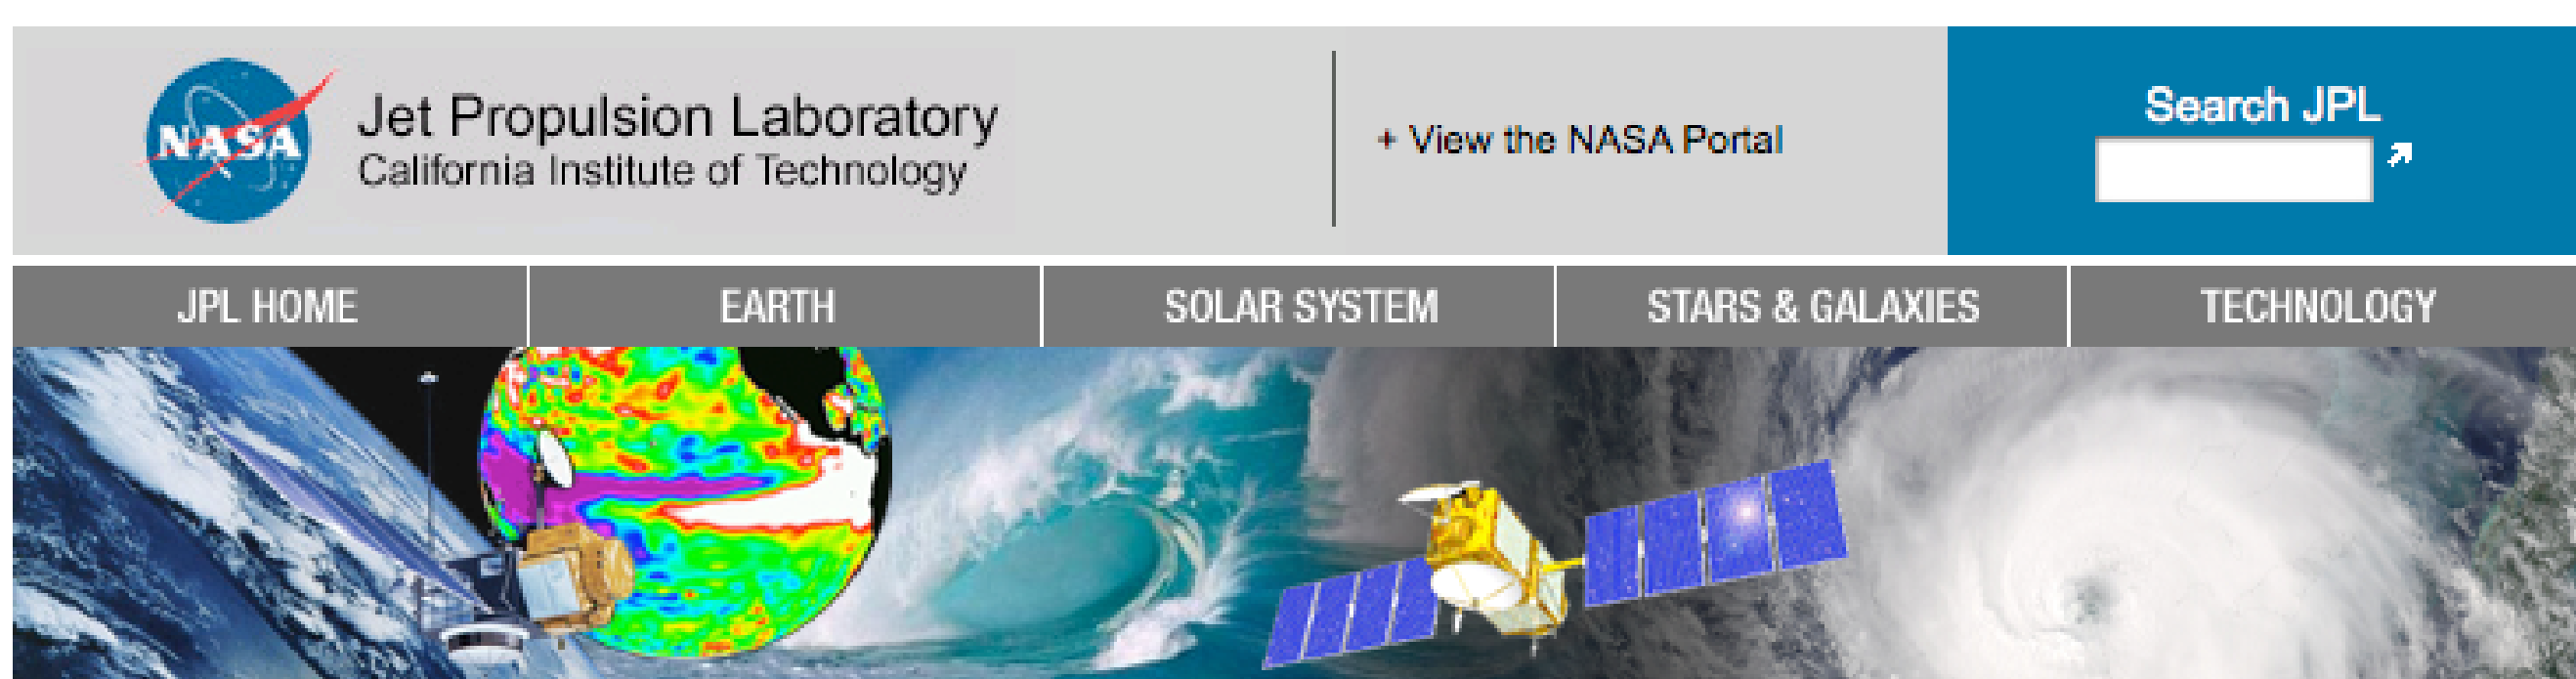

Approach

- Build on SciFlo system for user interface, data access, algorithm control
- Modularize Geophysical Data Record (GDR) update algorithms to provide processing functionality
- Integrate SciFlo and GDR algorithms
- Develop data subsetting (localization)
- Work with scientists, data centers to get access to models and data sets

Key Milestones

- Develop local processing, modular GDR algorithms 03/09
- Integrate SciFlo and modular algorithms 04-08/09
- Develop data subset capabilities 04/09
- Develop user-specified output formatting 08/09
- Develop collection of external data and algorithms 03-12/09
- Set up web presence and beta test with selected users 12/09
- Install test version at PO.DAAC 01/10
- Full integration with PO.DAAC 04/10
